Multi-Center Collaborative Survey Research with Blaise

Jim O'Reilly, Westat

Abstract:
A number of important research efforts using Blaise have been shared by the original investigators and applied and replicated by others, extending the reach of the research model in important ways. This paper reviews a number of these research series in terms of
• the extension and application by other investigators,
• the research gains from the replication and application to new samples and contexts,
• the technical features of Blaise that support this model of research, and
• the challenges for the original research group to enable and support the broad-scale application of their work.
