

## **The Many Faces of F1**

Siu Wan and Sheba Ephraim, Westat

The display of help text to interviewers or respondents depending on the mode of collection is an essential feature in Blaise. While we used function keys (F1) for online help in Blaise 4, we have a lot of additional options in Blaise 5. This paper discusses our use of different triggers in Blaise including function key events, button events, and hyperlink tags in field text; and the types of actions that we use to support survey help function needs including ToggleVisibility actions to show/hide field text with text role, StartLocalProcess actions to open local help files (.chm), and GotoUri (Uniform Resource Identifier) actions to open local files or websites on the Internet.
