Add code with 'Table' declaration

This table calls the block 'bInquiry'

Pros:

- Simple and easy
- Layouts in place
- 'Gets the job done'

Cons:

- Not much in terms of variety

TABLE tbPrice |

```

Setting the TableGroup errors in Layout

The screenshot shows the 'Interactive Edit CUSTOM RATES Survey' interface. A table titled 'Custom Services' is displayed with columns for 'Service' and 'Rate'. The 'Rate' column contains empty input fields. A callout box with the text 'Setting the TableGroup errors in Layout' has two arrows: one pointing to the table and another pointing to the 'ShowGroupErrors' property in the 'Properties' pane on the right. The 'Properties' pane shows various settings for the table, including 'Misc', 'Layout instructions', and 'Appearance'. The 'ShowGroupErrors' property is highlighted in yellow.

Setting Errors at the Table Level

‘ShowGroupErrors’ is the parameter to set to True to turn on the errors displaying at the bottom of the table.

The screenshot shows the 'Interactive Edit CUSTOM RATES Survey' application. The main window displays a table with columns for State/ID/Tract/Subtract, Srata, Batch #, Status, and various rates (9901-9904, DdAcPrStat). Below the table is a 'Custom Services' section with rows for different agricultural tasks and their corresponding rates. A green callout box with the text 'Setting the TableRow errors in Layout' points to the table area. On the right, the 'Properties' panel is open, showing the 'Misc' section with various parameters. The 'Parameters' section at the bottom right has a green callout box highlighting the 'ShowErrorText' parameter, which is currently set to 'False'. A black arrow points from the 'ShowErrorText' parameter to the 'ShowErrorText' property in the table's layout instructions.

Setting Errors at the Row level

‘ShowErrorText’ is the parameter to set to True for errors displayed at the row level.
