

Automated Regression Testing of BLAISE INTERNET: A Case Study

Karen Brenner and Sudha Manoj, Westat

Abstract:

A testing product, TestPartner, is being used to automate test cases for some Blaise projects. This paper will review the pros and cons of automated testing and considerations in making a decision about whether automation is the best option for a particular project. We will walk through the automated testing life cycle as it compares to the software development life cycle, and discuss approaches to reduce total testing time while representing a broader range of testing scenarios. Tips will be provided on issues to consider when using this method to specifically test CAPI.
